# At a glance | December 2025

- Seasonal spending rises, but year-on-year (YoY) data shows persistent consumer strain
- Year to date (YTD) December 2025: A continued deceleration in card spending
- YTD December 2025: Online spending remains resilient but slows down
- YTD December 2025: Credit card usage accelerates as consumers seek flexibility
- Tourism: A positive and diversified tourism growth trajectory for 2026

Effective December 2024, our reporting framework has been revised to incorporate an expanded set of data sources. In addition to merchant transaction data, which previously formed the sole basis of these reports, we now include consumer issuing data. This enhancement may result in variances in trend analysis when compared to prior reports. For clarity: Consumer issuing data refers to card transactional information associated with Absa clients holding debit and credit cards. Merchant transaction data refers to transactions processed through Absa’s merchant devices, including payments made with cards issued by various banks.

*The analysis presented in this report is based on the data available at the time of writing and is subject to change. Consumer spending data is inherently subject to limitations. Sampling methods and reporting lags can introduce some level of error. The findings presented in this report are based on our interpretation of the data, and different interpretations are possible. This report may contain forward-looking statements about consumer spending trends. These statements are based on assumptions and are subject to risks and uncertainties. We encourage this report’s users to carefully consider these limitations and to consult other information sources before making any decisions based on the information presented herein.*

# December 2025 overview

## Seasonal spending rises, but YoY data shows persistent consumer strain

### MTM data shows the expected rise in card activity

Absa’s internal MTM data indicates a typical seasonal uptick in consumer card activity in December 2025 when compared to November 2025. Card spending grew by 10% (versus 9% in November), while the volume of transactions increased by 7% (versus 2% in November). This pattern reflects expected year-end behaviour, where consumers typically engage in higher spending.

### Demand softens on a YoY comparison

The YoY view reveals a more subdued demand environment (see table 2\*). Card spending declined by 3%, and transaction volumes fell by 4% in December 2025, relative to December 2024. This suggests that while seasonal momentum remains intact, structural pressures – such as household income constraints and elevated living costs – continue to soften overall card spend levels.

Across the 29 tracked spending categories (table 2\*), the YoY contraction is heavily influenced by underperformance in the food category, which holds the largest market share in the spending basket (Dec-25: 44%). The persistent decline in food-related spend has an outsized effect on aggregate levels, amplifying the downward trend. Further deepening this decline are the top five underperforming categories (table 3\*), which include four of the 10 largest categories by market share. Weakness in these high-weight categories creates significant drag on total consumer spend.

In contrast, the top five performing categories (table 3\*) show more positive momentum but carry comparatively lower market share weight. Under the top five performing categories, only two – namely Government, and Health and beauty – feature among the top 10 by market share. Government spend increased by 36% YoY (Dec-2024: 16%), largely driven by higher payment activity related to public services and regulatory obligations. Health and beauty grew by 28% YoY (Dec-2024: -2%), reflecting a continued rising consumer prioritisation of wellness and personal care. Additionally, the Education category recorded seasonally aligned growth as households prepared for the upcoming school year, which contributes positively to overall category performance, though it is not sufficiently weighted to offset declines in larger segments.

While MTM trends reflect the typical year-end uplift in spending and transaction activity, the YoY declines point to sustained financial pressure on households and shifting consumption behaviour. The contraction in high-weight categories – most notably Food, which plays a dominant role in overall spend – has been a major driver of the subdued YoY performance. Even with pockets of resilience in categories such as Government, Health and beauty, and Education, these gains are insufficient to counterbalance the decline in larger, structurally significant segments.

Overall, the data suggests that although consumers continue to participate in festive spending cycles, broader economic headwinds are compressing their real purchasing capacity. This will remain an important dynamic to monitor in early 2026, particularly as essential categories continue to carry disproportionate influence on aggregate spend outcomes.

YTD December 2025

Your story matters

# YTD | December 2025

## A continued deceleration in card spending

Absa’s YTD December 2025 merchant data points to a persistent deceleration in consumer card activity, signalling ongoing pressure on household finances and a structural shift in spending behaviour. Overall, card spend grew by only 3% YoY, down from 5% in 2024, while transaction volumes rose a modest 5% (graph 3). The continued 2% decline in average transaction values indicates increased price sensitivity, with consumers consistently trading down to lower-cost or smaller basket options.

### Category trends show broad-based softening

Overall, the data shows broad-based weakness across the 29 tracked card-spend categories (table 6) for the period under review. The slowdown is most evident in high-weight categories that traditionally underpin card spending. Food, one of the largest contributors to total card spend, grew by 3% YTD December 2025, down from 5% growth in the prior year, indicating continued strain on essential-spend behaviour. Business and professional services, another major category, contracted by 3% after recording 11% growth in 2024. This sharp reversal highlights reduced activity among small businesses, many of whom remain vulnerable to elevated input costs and reduced client demand. Clothing, also a high-share category, posted muted growth of 1% YoY, below the 2% recorded in the previous period, further reinforcing the theme of constrained discretionary spending. In contrast, Health and beauty (a top 10 category by market share) has shown a consistent upward trajectory, from 1% growth in 2023, to 15% YTD December 2025. This outperformance is likely supported by social-media-driven consumption trends and the “lipstick effect,” where consumers shift toward smaller, feel-good purchases during periods of financial pressure.

### Top five performing categories

What to note about the top five performing categories (table 7):

- Most of these categories fall outside the top 10 by market share, with the only exception being Government services, which continued to show strong growth at 19% (albeit down from 22% last year).
- Their growth is off a very low base, meaning the strength observed should be interpreted cautiously, as small absolute changes translate into large percentage movements.
- No essential-spend categories appear among the top performers, indicating that the outperformance is not coming from core consumer spending.

### Top five underperforming categories

Key insights from the five weakest-performing categories (table 7):

- Three of the bottom five categories rank among the top 10 by market share, which amplifies their impact on overall YoY card-spend weakness and helps to explain the broader drag on performance.
- Books and newspapers declined by 10%, while Digital print media rose 15%, highlighting a continued shift in consumer preference toward digital content consumption.
- Business and professional services continues to contract, reflecting reduced activity among small businesses – a segment particularly vulnerable to subdued demand and rising operating costs.

# YTD | December 2025

## Online spending remains resilient but slows

Despite moderating momentum, online spending continues to grow at double-digit rates. Overall, online spend expanded 17% YoY (graph 4), supported heavily by online food-related purchases.

Notable category movements online include (table 8 and 9\*):

- Online food spending grew 37% YTD December 2025, an improvement from 31% during the same period in 2024, with its share of online spend rising from 19% to 22%. The data reinforces that a food retailer without a strong online presence is increasingly disadvantaged, as consumer preferences shift toward convenience-focused digital shopping.
- Transport, driven predominantly by e-hailing services, rebounded strongly with 74% YoY growth, a recovery from the previous 32% decline. Online market share rose from 4% to 6%.
- Home and garden, which holds a sizable 21% share of online spending, slowed significantly to 4% growth (from 26% in 2024).
- Online gambling’s market share remained unchanged at 5%, while spending increased by 22% – a notable moderation compared with the 66% growth recorded in YTD December 2024.

## In-store spending continues to dominate but softens

In-store card spending remains the dominant purchasing channel, holding a 90% market share YTD December 2025 (slightly down from 91% in 2024). However, despite remaining the most dominant channel, growth in physical-store spending slowed to 1% YoY, down from 4% in the previous period.

Key insights (table 10 and 11\*):

- Food maintained a substantial 48% share of in-store spend, with growth moderating to 1% (down from 4% last year). This high market share indicates that while online channels continue scaling rapidly, physical retail remains the core channel for essential, high-frequency purchases.
- Clothing retained the second-largest in-store market share at 11%, with an 8% share online. However, both channels recorded YoY declines, reflecting continued pressure on discretionary spending.

## Credit card usage accelerates as consumers seek flexibility

Credit card spending increased by 8% YoY (graph 5), accelerating from the 5% growth recorded in 2024. This reinforces the trend of consumers leaning more heavily on credit, both to access rewards benefits and to compensate for sluggish income growth.

Key essential-spend categories reflect this shift (table 12 and 13\*):

- Food: Credit card spend rose by 10%, whereas debit card usage grew by only 1%, signaling a clear pivot toward credit to manage everyday necessities.
- Clothing: Similarly, growth in this category is increasingly credit-driven, with credit outpacing debit spending on a YoY basis.

Overall, this pattern underscores shifting payment behaviour and rising dependence on credit facilities to sustain both essential consumption and lifestyle-related purchases amid continued financial pressure.

# Tourism: Outlook for 2026

## A positive and diversified tourism growth trajectory

South Africa remains one of the world’s most captivating destinations. It’s a country where breathtaking landscapes, abundant wildlife, vibrant cities and rich cultural heritage converge to create an experience unlike any other. From the Western Cape’s dramatic cliffs and Limpopo’s vast bushveld, to Johannesburg’s energetic streets and KwaZulu-Natal’s idyllic coastline, South Africa offers an unmatched blend of adventure, relaxation, history and modern urban appeal. This natural and cultural diversity continues to draw millions of visitors each year, making tourism one of the country’s most dynamic and resilient sectors.

Against this backdrop of enduring beauty and global appeal, BMI\* has released its 2026 *Tourism Outlook*, revealing a sector poised for strong growth in the year ahead and beyond. Drawing on data published by BMI on 14 January 2026, the outlook highlights rising visitor arrivals, strengthening business-travel demand and growing opportunities supported by South Africa’s economic and sectoral developments. Below is a summary of the key findings, tailored for our clients.

### Tourist arrivals to surpass pre-pandemic levels

According to BMI, total tourist arrivals in South Africa are expected to reach 11.1 million in 2026, representing an 8.4% YoY increase and surpassing 2019/pre-pandemic levels. Arrivals recovered fully in 2025 at an estimated 10.3 million, slightly above the 2019 figure of 10.2 million. Over the medium term, BMI forecasts arrivals to continue rising, reaching 14.2 million by 2030, noting that the below African region will remain the largest source of inbound travelers in 2026.

Projections include:

- Zimbabwe accounting for 20.8% of arrivals (2.3 million visitors)
- Mozambique accounting for 14.5% (1.6 million visitors)
- Long-haul markets, such as the UK, US and Germany, also growing steadily in line with rising disposable incomes and demand for affordable mid- to long-haul travel options. Visitors from the UK alone are expected to make up 4.2% (466 260) of total tourist arrivals in 2026.

### Leisure travel dominates, with business travel set to expand

BMI’s data shows that leisure travel remains the central driver of South Africa’s tourism performance. Between January and November 2025, leisure accounted for 97.18% of total travel by purpose. However, the report highlights that business travel is rising. Travel for business purposes increased from 2.15% in 2019, to 2.31% in 2025, supported by South Africa’s:

- Strong financial services, mining, agribusiness, transport and energy sectors
- Increased meetings, incentives, conferences and exhibitions (MICE) activity
- Role on major international platforms such as BRICS and the G20, both of which have recently attracted business delegations and events.

Business-related travel is anticipated to become a more significant contributor to total tourist arrivals over the medium term.

# Tourism: Outlook for 2026

**Provincial outlook: Mpumalanga, Limpopo, Gauteng and the Western Cape lead**  
South Africa’s nine provinces offer diverse tourism experiences, with certain regions expected to lead arrival numbers in 2026.

**Top provincial performers**

- Mpumalanga and Limpopo: Expected to attract the largest number of arrivals due to their proximity to Zimbabwe and Mozambique, and their role as key logistics and tourism gateways.
- Gauteng: A major commercial hub offering cultural and heritage attractions such as the Apartheid Museum, Maboneng Precinct and Vilakazi Street.
- Western Cape: Renowned for global urban and leisure appeal, including Table Mountain, beaches, gastronomy, wine tourism and historic sites such as Robben Island.

These regions will continue to anchor both leisure and business travel in the coming years.

**Conclusion**

BMI’s latest analysis points to a resilient and expanding tourism sector, driven by a strong rebound in leisure travel and rising levels of business-related travel. Combined with economic diversification, fintech innovation and growth in strategic sectors such as mining and financial services, South Africa is well positioned to achieve sustained tourism growth up to 2030.

# At a glance | November 2025

- Month to month (MTM): Momentum continues to build ahead of the festive season
- Year to date (YTD) November 2025: Spending contraction and volume moderation
- Black November delivered muted performance
- The 2025 Black Friday weekend, including Cyber Monday, reflected the broader slowdown trend
- Is it time to rethink Black Friday in Africa?

Important: As of December 2024, there has been a significant change in our reporting. We've expanded our data sources to include both consumer issuing data and merchant transaction data. Previously, the report was solely based on merchant transaction data. This change may result in slight variations in the observed trends compared to previous reports.

*The analysis presented in this report is based on the data available at the time of writing and is subject to change. Consumer spending data is inherently subject to limitations. Sampling methods and reporting lags can introduce some level of error. The findings presented in this report are based on our interpretation of the data, and different interpretations are possible. This report may contain forward-looking statements about consumer spending trends. These statements are based on assumptions and are subject to risks and uncertainties. We encourage this report's users to carefully consider these limitations and to consult other information sources before making any decisions based on the information presented herein.*

# MTM | November 2025 overview

## Momentum builds ahead of the festive season

Absa’s internal merchant and card data reveal that November sustained the positive momentum established in October, with a notable growth in card spending. Card spending grew by 9%, while transaction volumes increased by 2%, compared to 4% and 2% respectively in October (see graph 1 and 2). This growth was concentrated within the top 10 categories, highlighting the influence of seasonal promotions.

### Category highlights\*

- **Food:** Representing 44% of market share, food spending rose by 7%, up from 3% in October.
- **Clothing:** With an 11% share, clothing recorded a remarkable 24% growth, compared to 6% in October.
- **Home and garden:** Holding a 7% share, this category surged by 35%, a significant jump from 5% in October.

The sharp increases align with Black November and Black Friday campaigns, which continue to shape consumer behaviour. A notable development was the entry of Government spending into the top 10 categories, displacing Tourism. However, Government spending declined by 12% and still made the top 10, while Tourism fell by 4%, signalling evolving priorities in discretionary spending and seasonal travel patterns.

Despite strong MTM gains, on a year-on-year (YoY) basis, growth was more modest, with card spending increasing by 1% and transaction volumes by 0.5%. This suggests that while promotional events drive short-term spikes, underlying consumer sentiment remains cautious. The rising cost of living and slower wage growth continue to exert pressure, even as broader economic indicators appear favourable.

## Seasonal shopping behaviour

An analysis of seasonal shopping behaviour reveals a recurring pattern, as heat map\* data indicates a consistent “green glow” during seasonal peaks – March, July and the start of Q4 – indicating consumers’ preference for discount-driven purchases. This trend is particularly evident in Electronics and computers, where events like Black Friday and Cyber Monday have become firmly established in consumers’ minds. As a result, many shoppers postpone significant purchases in this category until these sale periods, leading to double-digit growth in November, far outpacing other months.

## Looking ahead: December outlook

- Historically, December demonstrates a pronounced surge in spending across food, clothing and specialty categories, which collectively account for nearly 60% of market share:
- **Food and clothing:** Driven by festive essentials and gifting.
  - **Specialty (including alcoholic beverages):** Consistently records double-digit growth, reflecting indulgent spending during the holiday season.
  - **Non-governmental organisations (NGOs), social and religious services:** Peaks in December, aligned with the spirit of giving, albeit from a smaller base.

Given these dynamics, December is expected to sustain growth, but retailers should anticipate post-holiday slowdowns and plan strategies to maintain engagement into Q1 2026.

YTD November 2025

Your story matters

# YTD | November 2025

## Data shows spending contraction and volume moderation

YTD November 2025 performance reflects a noticeable slowdown in card activity compared to prior years. Card spending slowed down to 3% YoY, down from a 6% growth recorded in YTD October 2024 (see graph 3). Transaction volumes also moderated to 6% YoY, versus 9% previously. Despite this deceleration, volumes continue to outpace spending, signalling sustained consumer engagement at lower ticket sizes. The average ticket value (ATV) declined by 3%, deepening from a 2% decline in the same period last year. Consumers may be making more frequent purchases of everyday essentials (e.g. groceries and utilities) rather than high-ticket discretionary items. In addition, growth in mobile wallets and contactless payments encourages micro-transactions (e.g. quick-service restaurants, ride-hailing and streaming subscriptions).

- The slowdown is concentrated within the top 10 categories by market share. While these categories lost only marginal share\*, the impact has been significant on overall card spending.
- **Food**, the largest category with a 45% market share, grew by 3% YoY versus 6% in the previous period.
  - **Business and professional services** (11%/second-largest share) declined by 2%.
  - **Clothing** (third-largest share) posted an only 1% increase.
  - The standout performer was **Health and beauty**, which surged 13% from 8%, despite holding just 2% share. Growth in this segment is driven by retailers expanding health and beauty offerings, positioning the category as a growth frontier. Purchases here are typically low-value and perceived as affordable indulgences, aligning with self-care trends amid economic caution. The trend is further amplified by the subcategory, retail pharmacies, which offer affordable quality healthcare, attracting uninsured consumers.

Online spending (graph 4) continues to serve as a critical growth driver for card transactions, though its momentum is beginning to moderate. YTD November 2025 online spending expanded by 18%, compared to 21% in the previous period, signalling that while digital adoption remains strong, the market may be approaching a point of maturity. The food category leads this growth trajectory, holding a market share of 22% (up from 19% in YTD November 2024) and posting a robust 39% YoY increase in spending versus 33% previously. This reinforces the growing consumer preference for convenience and the reliance on digital platforms for everyday essentials. Conversely, in-store spending growth slowed sharply to 2% from 5%, underscoring a structural shift toward e-commerce and digital channels.

Credit card (graph 5) spending accelerated to 8%, up from 6% in the previous period, driven by increased usage across leading categories, with particularly strong growth in Health and beauty. In contrast, debit card spending posted only a modest 1% increase from 5%, signalling a shift in consumer payment preferences. This trend perhaps reflects nuanced behaviours, including consumers transferring their own funds to credit cards to maximise rewards and loyalty benefits, as well as leveraging credit facilities to supplement income amid ongoing financial pressures.

## Conclusion

YTD performance highlights ongoing consumer constraints. Despite relatively favourable economic conditions, spending behaviour indicates that financial pressure persists. The data suggests that consumers remain engaged with retailers, but on their own terms: prioritising smaller, more frequent transactions, leveraging credit cards when personal funds fall short, favouring online channels for convenience and speed, and even allocating spend towards categories such as Health and beauty.

**Black Friday 2025**

Your story matters

# A bleak Black Friday

In the October [edition](#), we highlighted the financial strain facing South African consumers, noting that despite some relief in interest rates and inflation, signs of distress remained evident. At the time, we anticipated that while consumers would still engage in Black Friday, their focus would be on affordability and essential purchases. This cautious, value-driven approach has now manifested in a disappointing Black Friday performance, reinforcing the trend of strategic spending and subdued confidence. The challenge, however, is not limited to consumers. Retailers are operating in an increasingly competitive environment, with new entrants vying for market share and profit margins under pressure. Structural constraints make it difficult for retailers to offer deep discounts without eroding profitability, while consumers under significant financial strain are unable to participate at the levels once seen when long queues were a hallmark of Black Friday.

In this edition, we present a high-level review of Black November’s performance, assess the Black Friday weekend including Cyber Monday, and provide a day-by-day analysis of the Black Friday period.

### Black November

The month delivered muted performance. Card spending and transaction volumes grew by a marginal 1% YoY while the ATV value declined by 1% (see graph 6). This pattern indicates that consumers remain active but are spending less per transaction. The performance was characterised by broad-based weakness across categories with only limited pockets of growth.

### Top categories under pressure

Food, which commanded 44% of market share during this period, grew by only 1% YoY compared to 10% growth in the previous year. When even essential spending stagnates, it signals that household budgets are operating under real constraint. Clothing, holding 11% market share, moved into decline, contracting by 1% YoY, after delivering 9% growth in the prior year. Business and professional services, also at 11% share, fell by 10% YoY – a worrying signal for small business confidence and informal sector resilience (see table 14–15 on slide 16).

### Despite the overall muted performance, some categories posted healthy gains:

- **Health and beauty** surged by 34% YoY, up from 9% in 2024.
- The **Government** category grew by 20%, though this was down from 34% last year. This category is not a typical Black Friday category but rather a compliance-driven category that reflects obligation rather than choice.
- Meanwhile, **Electronics and computers**, typically a non-core and highly cyclical category, recorded a 10% recovery in spending, exhibiting patterns consistent with promotion-driven demand, not organic consumer confidence.

This mixed activity among top categories contributed to the overall slowdown in Black November performance.

Online shopping during Black November 2025 slowed markedly, growing only 6% YoY compared to 12% in the previous period. Categories that traditionally drive online sales – such as Food and Home and garden – either stagnated or declined. Clothing, however, posted 9% growth versus just 1% last year. In-store spending declined by 0.3% YoY, a sharp reversal from the 9% growth recorded in Black November 2024. The Food category, which dominates in-store share, grew by only 1% YoY compared to 15% last year, while Clothing declined by 2%, further dampening overall performance.

### The weekend that no longer anchors the season

The Black Friday weekend, including Cyber Monday 2025 (see graph 7), reflected the broader slowdown trend. Card spending growth eased to 5% and transaction volumes to 3%, down from 13% and 14% in the prior period. Meanwhile, ATV showed only a slight recovery, rising by 1.9% after its previous decline.

# A bleak Black Friday

The daily performance data (see graph 8 and 9) provides the strongest indication of structural shifts in consumer behaviour. Cyber Monday outperformed expectations with 11% YoY growth, while the anchor day – Black Friday – remained virtually flat at 1.4%. Notably, transaction volumes declined by 1% on Black Friday, contrasting with Cyber Monday, which recorded the highest volumes of the entire period. A key contributor to this muted trend was the Food category, which experienced slower growth compared to 2024. Most of the top 10 categories by market share are either contracting or growing at a reduced pace, with Health and beauty being the sole exception, posting robust gains throughout the whole weekend. Given the significant weight these categories hold, their deceleration has driven an overall decline in daily performance. Among all days, Saturday and Cyber Monday emerged as the strongest performers, signalling a shift in consumer engagement patterns.

## Key findings from daily performance

### Standout growth categories (2025)

- Transport posted the highest growth rates across all four days: Black Friday: +42.55%, Saturday: +42.23%, Sunday: +45.65% and Cyber Monday: +58.30%.
- Health and beauty also saw strong gains throughout the weekend, especially on Sunday (+101.11%) and Saturday (+64.41%).
- Education and Funeral services recorded notable spikes on Sunday (+296.57% and +175.58%, respectively).

Although the above categories posted impressive growth rates, they started from a relatively low base. Health and beauty, however, is a key player within the top 10 categories by market share in card spending.

### Categories with the largest declines (2025)

- Books and newspapers experienced a sharp drop on Sunday (–42.69%).
- Games and gaming fell on Cyber Monday (–89.26%).
- Telecommunication saw a significant decline on Sunday (–36.43%).
- Home and garden, and Building and hardware also posted negative growth on some days.

Daily trends highlighted how consumers engaged during this period. Cyber Monday delivered the strongest online performance\*, with a 31% YoY increase – slightly above last year’s 30% – underscoring its position as an online-centric event. Conversely, Sunday was the weakest day for online sales, plunging 24% compared to an 18% increase in the prior period. For in-store activity, Sunday recorded the highest growth at 7%, though this was down from 13% last year. Notably, online sales on Black Friday itself were flat, declining by 0.2%. Examining how consumers fund their purchases uncovers valuable insights into consumer confidence, liquidity and spending priorities. Among the top 10 card-spending categories, credit card usage\* continued to outpace debit card transactions, although the growth rate was slower than in the previous year. This trend provides important insights into consumer behaviour under current economic conditions. The increased reliance on credit may indicate two underlying dynamics: first, consumers transferring funds from debit to credit cards to maximise loyalty rewards and benefits during promotional periods, and second, a growing dependence on credit as a means to bridge liquidity gaps amid financial strain.

## Is it time to rethink Black Friday in Africa?

In 2023, we wrote an [article](#) questioning whether Black Friday should be reimagined for the African retail context. What seemed provocative then feels pragmatic now. The pressure on retailers to deliver deep discounts in a challenging economic environment risks thinning margins. At the same time, consumers remain under significant financial strain, and even historically strong triggers – such as payday alignment – failed to deliver meaningful uplift during Black Friday 2025. Adding to this, we now see a value-driven consumer who shops for discounts year-round, diluting the impact of Black Friday as a single event. Financially constrained shoppers are increasingly unwilling to pay full price, opting instead to purchase only when their needs align with promotional offers. This marks a critical shift: When liquidity timing loses its influence, confidence (not cashflow) becomes the primary constraint. The reality is clear: Either the hype around Black Friday has faded, or consumers have stopped believing the narrative. Both may be true, and both point to the same conclusion: The traditional Black Friday model may be losing relevance in Africa’s retail landscape.

Despite the current challenges, Black Friday remains the most significant event on the retail calendar, a cornerstone of annual performance for many retailers. It is deeply entrenched in consumer consciousness, with shoppers anticipating the opportunity to engage. However, the prevailing economic environment is far from conducive for participation at the levels seen in previous years. Financial strain, muted confidence and structural shifts in spending behaviour have constrained consumers’ ability to capitalise on the event, even when intent to participate remains strong. For retailers, this creates a paradox: The event is too important to ignore, yet increasingly difficult to execute profitably. Balancing consumer expectations for value with sustainable margins will require innovation beyond traditional discounting strategies. The question is no longer whether Black Friday will happen, because it will, but whether its current model can evolve to remain relevant in a market defined by caution.

# Spend analytics: PocketFlow

Your story matters

A big-data web-based tool that takes you beyond the limitations of traditional banking

Do you know who your customers are, what their spending behaviour at your store is, or how you compare to your competitors?

Now you can, with Absa's spend analytics tool, PocketFlow.

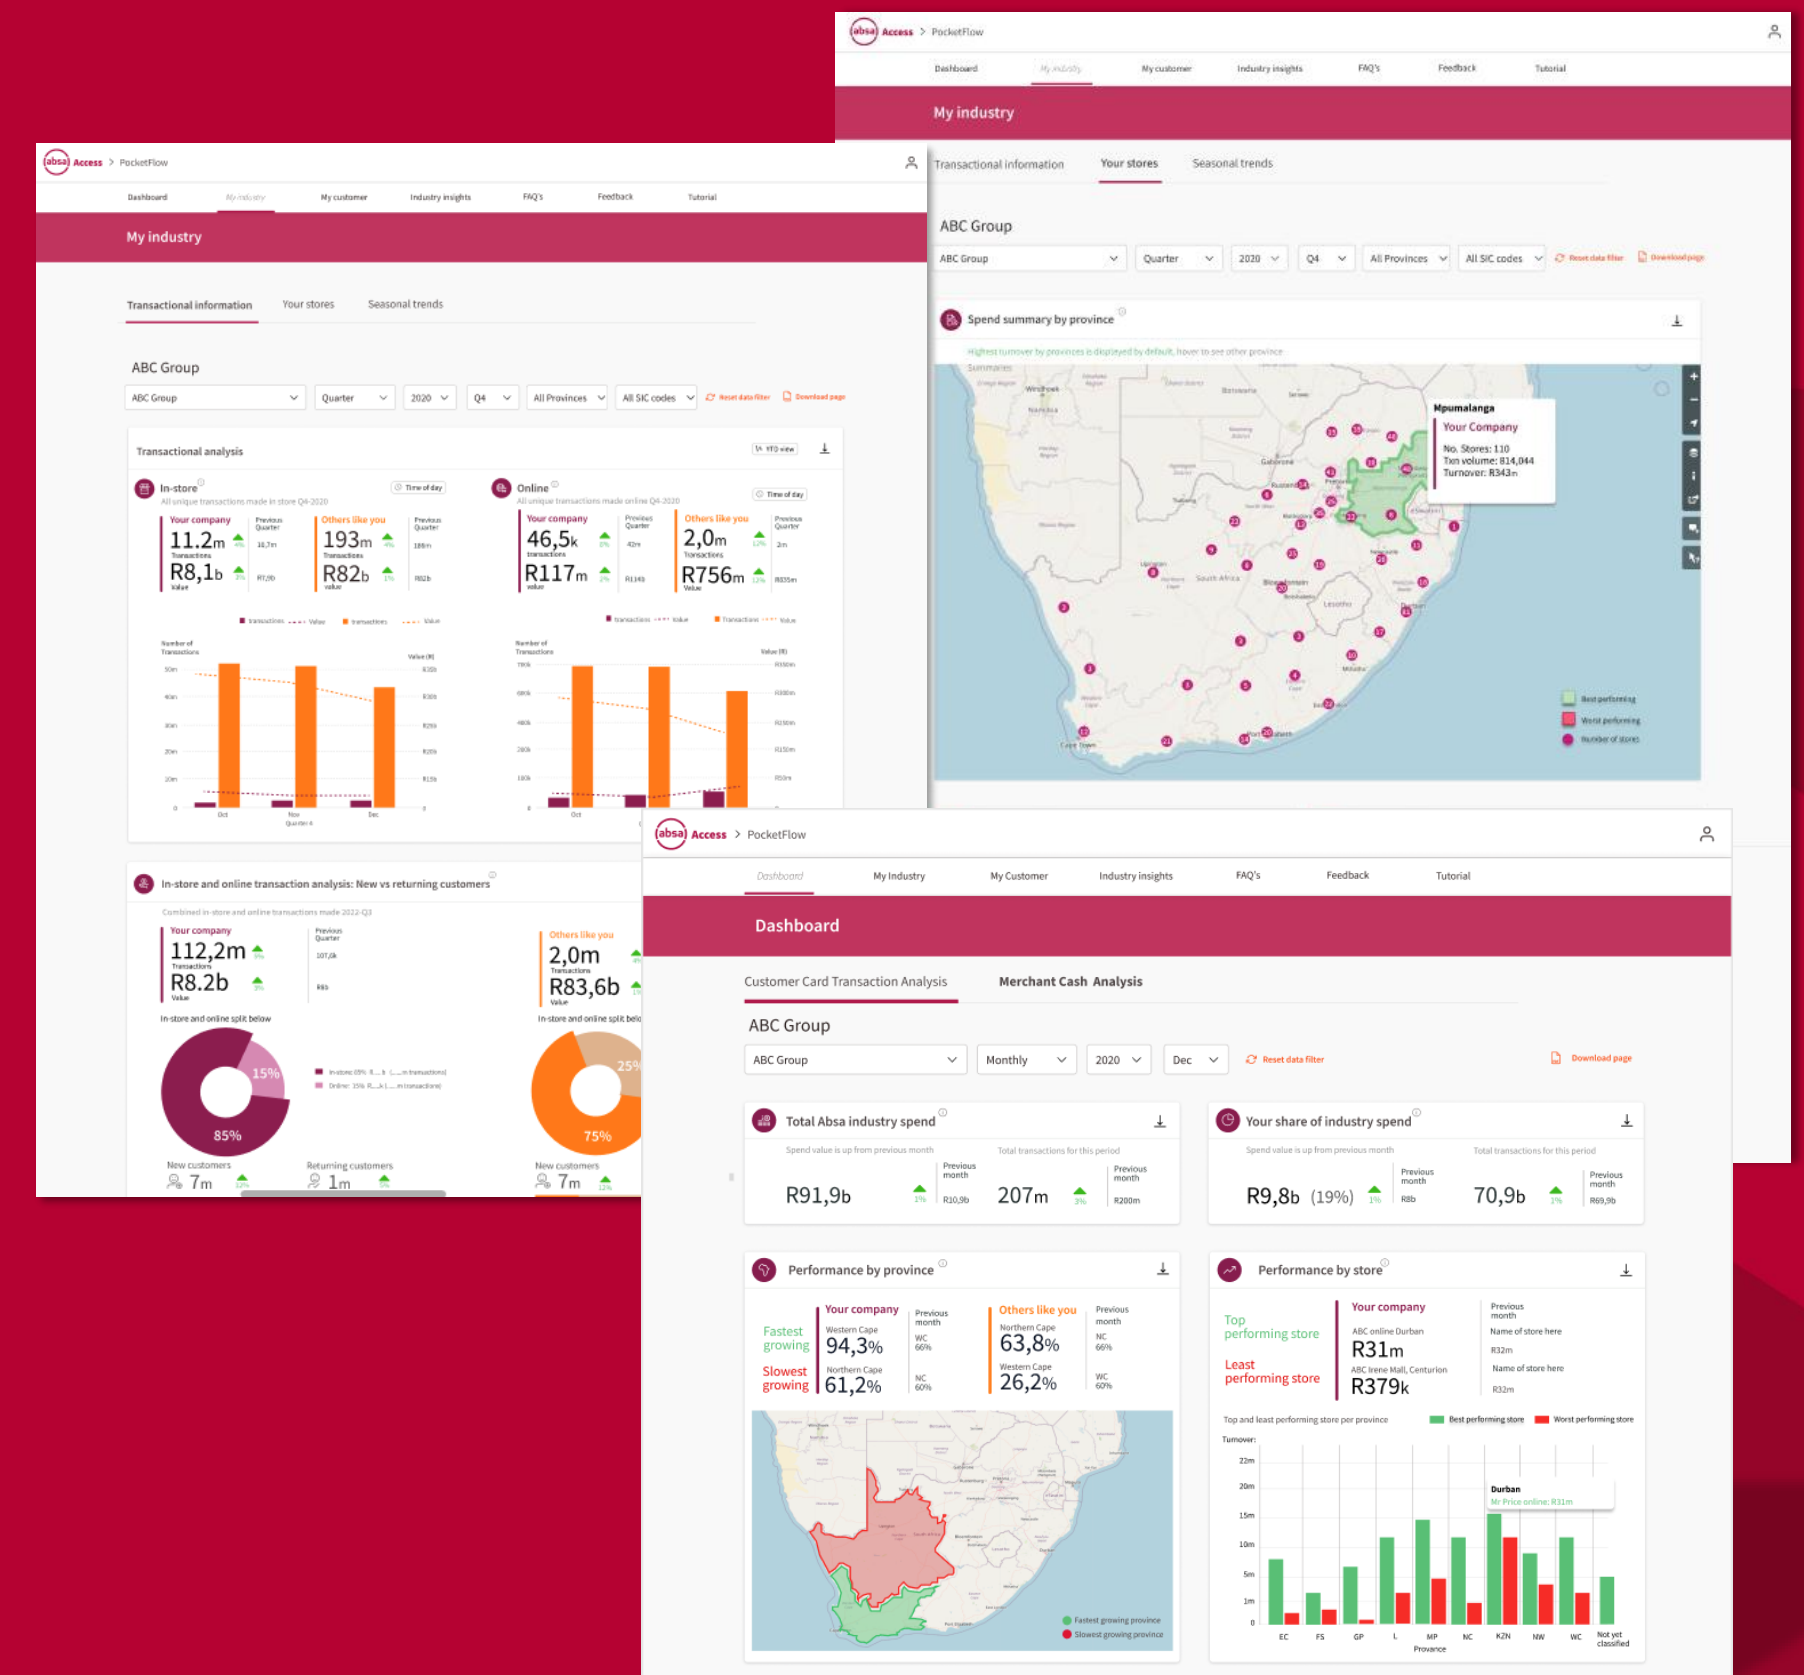

This tool is designed to help you understand your customers better and optimise your business strategies. Its interactive customer visualisations enables you to better understand your business's performance and gives you further actionable insights.

PocketFlow is a self-service tool that doesn't involve a complicated installation process or require specialist IT skills to implement or use.

There are two offerings available, namely:

- **PocketFlow** (for large corporates): Speak to your Business Banker to find out more.
- **PocketFlow Lite** (for small and medium enterprises): Register on the Absa Merchant Access Online (AMAO) portal at <https://absamerchantaccessonline.absa.co.za>

Start your PocketFlow spend analytics journey today!
